## FOREWORD

A twenty-fifth annual report is an opportunity to record the events of a year, an occasion for obtaining a perspective, and a chance to note health trends both constructive and otherwise over a period of a quarter of a century. It also provides for inventories and comparisons which give substance to conclusions as to the physical condition of students entering the University during the last twenty-five years.

The objectives of the Health Service were rather clearly defined at its beginning, and efforts during the last quarter of a century have been directed to their attainment rather than to the seeking of new goals merely to insure growth. During this period, it has been kept constantly in mind that enduring progress can be achieved only by the adoption of policies and practices which time will justify.

A health service program to be adequate for a large institution of higher learning must provide for the extensive application of the principles of preventive medicine and sanitation in seven different but more or less related fields of health promotion and disease prevention:

1. Provision of a Healthful Environment

Students must have wholesome surroundings if they are to escape epidemics, the annoyance of nuisances, and dangers from fire. Their environment must include safeguards against accidents, and a good moral atmosphere. The houses in which they live, and the rooms where they learn must be clean, attractive, well-ventilated, and correctly illuminated both naturally and artificially. A safe water supply, proper disposal of sewage, clean, pasteurized milk, and carefully inspected food are essentials of good living conditions. Adequate protection for those handling injurious substances, using lethal gases, or coming in contact with plants or animals capable of producing disease, is an important consideration in the provision of a healthful environment.

## 2. Health Examination

A health examination of "all students entering the University for the first time" has been required since action by the Board of Trustees on March 12, 1918. It serves as an inventory of the physical and mental health of students, and provides the information essential for their classification for military training and physical education, and the correction and alleviation of defects and abnormalities.

Conditions found at the time of the examination afford an excellent opportunity to promote health education by discussing with students personally the nature, origin, and treatment of their physical or mental handicaps. They are also told where and how they may obtain the special attention required to meet their needs. The examination and its "follow-up" also impress upon students the importance of a periodic medical "check-up" and thus contributes to their keeping physically fit, and at their highest efficiency.

A medical examination makes possible the diagnosis of disease in its incipiency, the prompt institution of treatment, and the taking of immediate action for the control of communicable disease. It reduces to a minimum the risk of requiring compulsory exercise without the adoption of proper safeguards to protect students against injury. By encouraging them to correct their defects and dysfunction early in their college career, they are materially helped in making the most of the facilities offered for their education.

By requiring a physical examination of each student on matriculation, it is possible to avoid the futile procedure of giving men military training who would later be rejected for military service. This saves both effort and money. The examination aids in locating and preventing subnormal students carrying a study schedule which may threaten, if not actually precipitate, a physical or mental breakdown.

## 3. Prevention and Control of Communicable Disease

The Health Service uses every practicable means to prevent and control communicable disease among students, faculty, and employees. This effort reduces sickness and death rates from preventable disease to the minimum. It is based upon the sound economics of keeping the greatest number of students possible in in the classroom.

Immunization against smallpox and typhoid fever has been continuously promoted by a campaign of education. Students requesting it and procuring the vaccine have been immunized against diphtheria, scarlet fever, Rocky Mountain spotted fever, Asiatic cholera, and yellow fever. Only those individuals whose duties require them to visit localities where the latter diseases are endemic have been inoculated against them.

Early diagnosis of communicable disease is essential in the prevention of its spread. It insures immediate isolation and quarantine, and thus decreases the number of contacts. Quick discovery of infectious disease makes prompt treatment possible, reduces the likelihood of complications, and lessens the loss of time from classes.

With the approval of the State Department of Health, modified quarantine has been established. "Exposures" have been given daily inspections and have been permitted to attend classes. During the last decade this arrangement has saved students, faculty members, and employees the loss of many thousand classroom and work hours without endangering any of their associates.

#### 4. First Aid in Accident and Illness

The Health Service maintains a dispensary for ambulatory cases of accident or illness. This service is essential to detect communicable disease in its incipency and to reduce to a minimum the danger of serious infections resulting from minor injuries. It promotes prompt hospitalization which does much to reduce the severity of illnesses and injuries so often caused by delay or neglect. Dispensary service also makes possible quick referral of the ill and injured to competent physicians and specialists.

First Aid Cabinets are located in convenient places in University buildings. These are equipped and supervised by the Health Service. The articles supplied to the cabinets are those approved by leaders in industrial surgery--the object being to provide all items necessary for the efficient rendering of First Aid preliminary to receiving medical attention, but not to encourage use of drugs or surgical materials by untrained persons, who in trying to do good, may do more harm than good.

#### 5. Promotion of Mental Health

The Health Service from its beginning has accented as self-evident that students not only need sound bodies and sound minds, but also wholesome, disciplined emotions, and a keen sense of social responsibility. At the time of the physical examination, efforts are made to detect students who may be nervously unstable or who give evidence of being maladjusted. This quest is continued through questionnaires in hygiene and in conferences relative to the findings of their medical examination. By frequent interviews where needed, and by "follow-up," students are helped in adjusting themselves to their surroundings and in obtaining satisfaction in their work.

#### 6. Health Education

As the functions of the Health Service at Illinois are primarily preventive and educational rather than therapeutic, sustained

efforts are made to encourage students to acquire good health habits and to adopt an attitude towards personal and community health which will carry over into life and prove an advantage to them, their families, their communities, and the Nation.

Emphasis has been placed on the attainment of good physical health and mental toughness essential to meet with equanimity the vicissitudes of life, to withstand the strenuousness of the times, and to insure social vigor. Through education in personal and community health, effort has been made to give the leader of tomorrow the knowledge, awareness, and desire necessary to participate intelligently in enterprises for the promotion of the welfare of the community in which he lives.

## 7. Health of Personnel

In institutions of higher learning, as in the primary and secondary schools, it has been recognized as of paramount importance that the health of personnel, whether professional, skilled, or unskilled, should receive close attention, so that they will not be a source of disease, shall possess the vitality essential to pursue their work effectively and shall set an example of vigor and accomplishment.

## SERVICES

### I. Routine Office Calls

During the academic year 1940-41, 13,108 students were enrolled in the University at Champaign-Urbana. A great majority of these called at the Health Service Station one or more times during the year. They made a total of 54,363 visits, or an average of 4.14 calls per student. The average for women was 4.32; for men, 4.08; for upper-classmen, 3.49; for freshmen, 5.29. In addition, there were 2,386 visits by University employees, and 137 miscellaneous calls making a grand total of 56,886 calls.

Of the total visits, 5,179 were made because of the required physical examinations, and 3,832 by students for conferences relative to them. For the last sixteen years, freshman men have made about 2.13 more visits per student than upper-class men; and freshman women, 0.56 more visits per student than upper-class women. The calls of the freshmen are exclusive of examinations and re-examinations, and are caused by their somewhat greater susceptibility to infectious disease, less knowledge of hygiene, less alertness in anticipating and caring for illness in its incipency, and greater need of adjustment.

Freshmen-Men  
Freshmen-Women

AVERAGE NUMBER OF CALLS FOR MEN AND WOMEN -- FRESHMEN AND UPPER CLASSMEN.  
1925-1926 - 1940-1941

There were 16,260 laboratory tests made for students and employees during the year; 11,394 at the Health Service Station, and 4,866 by the State Laboratory. Special tests were given 189 students who wished motor vehicle permits and 532 employees desiring to drive University cars.

## II. Medical Examinations

Complete physical examinations were given to 5,179 students during the year. Of those, 3,745 were men and 1,434 were women. Of this total, 453 were individuals who did not matriculate. Each year from 8 to 10% of those examined do not enter the University.

A total of 73 pupils seeking admission to the University High School were examined. Of these, 34 were boys and 39 were girls. Of this group approximately 48% had had their tonsils removed, none had serious abnormalities, and only 2.06 had not been vaccinated against smallpox.

Because of the turnover associated with war, the increase in the number of workers incidental to servicing the Union Building and the Residence Hall for men, 372 domestics and laborers were examined, who were prospective Civil Service employees. Of these, 286 were men and 86 were women.

In cooperation with the College of Engineering, twenty-three students who were candidates for the primary course

Chart No. 2

in the aviation training program were given preliminary physical examinations. This procedure saved a number of applicants from paying for special examinations when it was determinable in advance that they could not meet the physical standards of the Civil Aeronautics Authority.

Examinations for chauffeurs were given to 457 men and 75 women wishing to drive University automobiles. Of these, 471 were considered to be physically normal for driving, and 61 were found to have handicaps which made them increased risks when operating a car. A total of 189 students requesting motor vehicle permits were examined: 163 were found to be normal and 26 had defects which made driving more hazardous than ordinary. Fortunately, most of these abnormalities were associated with vision and were correctible by the use of glasses.

A total of 4,334 athletes were examined before participation in intercollegiate and intramural sports. Ten were rejected for the former, and eleven for the latter. The gradation of games on the basis of speed, strength, and endurance affords each student an opportunity to get exercise under conditions of greatest safety, when given proper preliminary training.

During the year, 863 foodhandlers were examined to determine their physical fitness and disease carrier states before serving in the food distributing agencies of the University; three prospective foodhandlers were discovered to be carriers of typhoid fever: one was a student expecting to take the course in Cafeteria Management; one to be a cook at the Union Building; and the third was to serve as a caretaker in Illini Hall. It is hardly necessary to speculate upon the harm a typhoid carrier could do in the kitchen of the University Cafeteria or dining service of the Illini Union.

Premarital examinations have been available to students since the enactment of the Salties law. During the year, 74 of them received the benefit of this service.

#### FOLLOW-UP

New Students: At the time that new students take their physical examination, a brief summary of the abnormal findings, if any, is made on their cards. Subsequently, they are recalled for conferences concerning the defects discovered, and are given advice regarding such correction and alleviation of their conditions as may be possible. A total of 2,091 men and 856 women were seen for this purpose.

Albuminuria: A total of 208 new students examined on matriculation in 1940-41 were found to have albuminuria. Repeated examinations showed the condition to be transient in 194 and persistent in 14 students. The latter were referred to their family physicians or to urologists for further study and treatment. One Civil Service employee had persistent albuminuria; of the 73 University High School students examined, only one had albuminuria. All of those seen at the Health Service Station who have persistent albuminuria are kept under observation.

Heart Disease: Of the 2,947 students examined, 43 were found to have cardiac abnormalities. These have been kept under observation, have been repeatedly examined, have been excused from physical education where the condition was marked, or have been given a program of exercise which will protect them against undue strain.

Tuberculosis: During the year, 55 students have requested tuberculin tests, of which 17 proved to be positive and 38 negative. Those who reacted positive have been urged to have roentgrams of their chests to establish as far as possible the extent and activity of their infection.

A detailed history, a thorough physical examination, and "follow-up" of suspicious cases are not enough to discover active tuberculosis in its minimal stage. Only by the wide use of the tuberculin test and X-ray of positive reactors can those with active tuberculosis be discovered in the student body and the greatest protection be provided for the University population. This procedure affords the best opportunity to discover tuberculosis in its earliest stage and to give treatment when "arrest" of the disease is most likely.

#### MENTAL HYGIENE

In addition to a regular physical examination, each student fills out a questionnaire which gives an insight into his health, mental state, habits, and living conditions. It supplements his medical record and physical examination, and is an important factor in determining his emotional development, attitude and adjustment.

Students found to have difficulty in adapting themselves to the demands of University life are seen periodically and every effort made to give them all possible assistance in adjusting themselves to their environment. They are encouraged to enter into forms of extra-curricular activity which will help them to find themselves and to achieve satisfaction in their work.

## COMMUNICABLE DISEASE

Prevalence: There was less communicable disease in the University population this year than last. Colds, influenza, diphtheria, impetigo contagiosa and scabies were less common. Measles, German measles, chickenpox and scarlet fever were more frequent. The communicable disease rate, including colds, per 1,000 students was 129 for 1940-1941; for 1939-1940, the year before, 148. A comparison of the cases occurring for the two years is shown in Table 4.

Although 79.7 per cent of the students had had measles (rubeola) on matriculation, mass immunity, presumptive resistance, or previous good fortune in avoiding contact did not provide the "shield of protection" for 16 susceptible students when it began to occur frequently in the schools of Champaign-Urbana.

German measles was epidemic in the Community during the year. A total of eighty-three students acquired the disease. The long incubation period, the early communicability, the polymorphous nature of its rash, and the absence or mildness of its constitutional symptoms make the control of this disease exceedingly difficult. Many students do not know when they are exposed, or that they have German measles until a doctor tells them the cause of their rash; by this time a number of their associates have acquired the disease.

Faculty and Civil Service Employees: Occurrence of communicable diseases in the families of faculty members and Civil Service employees was less than in previous years. Only eight cases were reported, of which three were chickenpox, two scarlet fever, two measles, and one German measles.

Total . . . . .	<u>1,694</u>	<u>1,959</u>

By the modified quarantine for scarlet fever, permitted by the State Department of Health, the loss of time from the classroom has been reduced to the minimum compatible with safety. Of the 222 students exposed to scarlet fever, 148 gave a positive Dick test, but were allowed to attend

classes after daily observation. This procedure saved a total of 888 school days or the equivalent of a full semester for eight students.

Venereal Disease: The quarter of a century which this report concludes has witnessed a complete revolution in the attitude of the public towards venereal disease. In 1916, as now, gonorrhea was widespread. The sterility it caused blighted the fondest hopes of many couples wishing children. Its victims crowded into clinics, increased taxes, and added to the death rate; but cultured people were indifferent, apathetic, and silent.

Syphilis, a protean disease, attacked at least ten per cent of the population, destroyed thousands of unborn children, caused many still-births, and was responsible for children afflicted in body and mind. It damaged the bones, tissues, and organs of both young and old. Impaired hearts, arterial degeneration, sclerotic spinal cords, paralytic gaits, and insanity followed in its wake; yet its name was never spoken in polite society. Not even the most courageous editor dared to go farther in his columns than to indicate by subtle innuendo that a serious "blood disease" existed.

All treatments for gonorrhea and syphilis were prolonged, inconvenient, costly, and left much to be desired. Thousands of dollars were spent for medical care; hundreds of millions for hospitalization of those made physically ill and mentally sick by the gonococcus and the pale spirochete. Men, women, and society suffered, paid, and did little to escape the blight that had attacked the race for centuries.

Suddenly, a new day dawned; common sense asserted itself. The veil of prudery was torn apart. Men and women discovered they could pronounce the words gonorrhea and syphilis. These diseases quickly made the headlines. Pamphlets flooded the mail. Exhibits appeared at meetings. Movies

brought the public up to date on venereal disease. Syphilis even became a topic for term papers for "coeds," and wherever two or three gathered together in a sewing circle, on the golf links, in the clubs, or on the street--syphilis and gonorrhea were discussed with the interest of men and women who had gained a new freedom. Caravans were formed for pilgrimages to where Kahn tests could be obtained free. Legislatures vied with each other in the adoption of inadequately considered legislation requiring premarital examinations. Laws to protect prospective mothers and unborn children against syphilis were passed without a dissenting vote. Laboratories were enlarged to do serologic tests, and facilities for treatment multiplied with most gratifying rapidity. The public awoke from its centuries-old nightmare; reticence disappeared and the battle against venereal disease had begun.

Fortunately, scientific discovery and medical progress were equal to the demand for action. The dark field microscope, serologic tests, and specific therapy were available for dealing with syphilis; the advent of the sulfonamide drugs and the use of heat provided highly efficient treatments for gonorrhea. Thus, the means, will, and enthusiasm to attack a great scourge were at hand, and man's redemption of man got under way.

Reared in such a venereal disease-conscious age, it is no surprise that the incidence of gonorrhea and syphilis is exceedingly low in college students--about one case in 500. During the year, 13 students were found to have gonorrhea; and 2, syphilis; one of these was congenital. Table 7 gives the result of 2,619 serologic tests done upon students for syphilis.

Table 4

Serologic Tests Done Upon Students  
for Syphilis

<u>Test</u>	<u>Negative</u>	<u>Positive</u>	<u>Total</u>
Kahn test . . . . .	2,596	.23*	.2,619

\*Seven students on whom a total of 21 Kahn positives were reported by the laboratory were asymptomatic, and Wassermann tests did not confirm the first findings. These were false-positives.

A Kahn test is a part of the routine physical examination of Civil Service employees. A total of 13 were found to have either late or latent syphilis. The incidence of lues is higher in this group than in students because of age permitting a longer period of exposure and less information concerning the disease.

Vaccination for Spotted Fever: This year, as last, students and faculty members who expected to study and to do

research in the Rocky Mountain region during their vacation, were inoculated against spotted fever. A total of five men and two women were immunized. The vaccine was furnished without cost by the special laboratory of the United States Public Health Service at Hamilton, Montana. Spotted fever, however, is no longer confined to the Rocky Mountains but occurs in most of the states of the Union

Table 3

Total. . . . .	<u>4,331</u>

## HOSPITALIZATION

The Student Body: The facilities of the McKinley Hospital are a great insurance for the student body. A total of 3,569 students was admitted to the Hospital for 12,188 days, an average of 3.42 days per patient.

Of all the students hospitalized, 90 per cent were admitted to McKinley Hospital and only 10 per cent to other hospitals. The local hospitals, however, had 12 per cent of the student patronage in hospital days; the McKinley, 88 per cent.

This difference between percentage of cases and hospital days is due to the low average stay (3.33 days) of students in the McKinley Hospital for medical cases and the longer hospitalization in local institutions for surgical treatment.

As will be seen from the following table, 559 students with communicable disease were admitted to the McKinley Hospital for a stay of 2,958 days or an average of 5.29 days per patient. Influenza was responsible for 107 or 17.4 per cent of the cases, and 443 or 14.9 per cent of the hospital days.

attention and 47 were referred to outside surgeons or specialists for prolonged treatment. Fourteen employees were hospitalized for a total of 110 days, or an average of 7.9 days per patient. Two of these cases were admitted for herniotomy, and remained in the Hospital for two weeks.

Hospital Insurance: A new method of hospital insurance was instituted in the University for the year 1940-41. The Student Mutual Benefit Association reinsured its prospective beneficiaries this year through the North American Accident Insurance Company. The plan, as usual, was ably promoted and carried out by the office of the Dean of Men. Its energetic campaign induced 6,173 students, faculty members, and employees to join during the first semester, and 5,122 the second, which was 47.09 per cent of the student enrollment for the first, and 39.08 per cent the second semester of 1940-41.

This year, as under the old plan, two types of membership were made available to students, faculty members, and employees. A \$3.00 payment provided for 30 days' ward care in any one semester plus \$5.00 allowance for laboratory charges; a \$5.00 premium which, in addition to the above, included a payment toward the physician's bill at the rate of \$3.00 per day for the two-thirds the number of days hospitalized

during the semester up to a maximum of two-thirds of 30 days at \$3.00 per day or a total of \$60.00.

The number of students having sickness insurance was somewhat increased by those patronizing companies now providing such a service. It is, nevertheless, regrettable that more students do not join the Association or otherwise provide protection for themselves, particularly during the second semester when sick rates are higher and hospitalization is often badly needed by those who can least afford it. As long as less than half of the student body has hospital insurance, both the control of communicable disease and the rendering of prompt treatment of the ill leaves much to be desired. There is also a correlation between delay in medical attention and the increase of complications and the severity of the disease.

A number of insurance companies of varying degrees of merit are trying to sell insurance to students. The extent and quality of the service they offer are not yet equal to that of the Student Mutual Benefit Hospital Association. Such companies generally offer much that will rarely be needed, but are more conservative where service is most likely to be used. Such action is essential where rates are low and considerable overhead has to be met before profits are made.

However, the publicity associated with their bids for business causes some students to make provision for illness who otherwise would not do so.

Local Hospitals: The Mercy and Burnham Hospitals admitted 357 students for a total of 1,473 days, an average of 4.14 days per patient. The average length of stays in these hospitals was 5.25 and 3.98 respectively, which are longer than those of the McKinley Hospital by 19 per cent. They admit students requiring surgery; hence, the prolonged period of hospitalization.

#### MC KINLEY HOSPITAL

Last year marked the completion of the south wing to the Hospital; the new addition is completely equipped. All rooms in the new unit were in use this year.

Patients: The Hospital was open for a period slightly over nine months. The first patient was admitted September 9, 1940 and the last discharged on June 30, 1941. A total of 3,072 patients were treated for a total of 10,735 days or for an average stay per patient of 3.49 days. Of this number 2,789 were bed patients and 283 out patients. The highest number of bed patients in any one day was 119. (See chart 4.)

The total number of patients admitted to the Hospital were 3,072, of whom 2,350 were students, 165 were members of the faculty, and 57 were outsiders who were chaperones, members of the family of operators of lodging houses for students, etc.

Of the patients entering the Hospital, 2,079 were members of the Mutual Benefit Hospital Association. Although only 43.08% of the students were members of the Hospital Association for both semesters, nearly 68% of those hospitalized were members. The benefits paid on these memberships amounted to \$28,925.10, or \$13.91 per patient.

Failure of students to join the Hospitalization Association results in greater exposure of their associates to communicable disease and of themselves to serious complications when ill. Grave cases of pneumonia are usually more common in those who are not members of the Association and delay going to the Hospital until they are too sick to avoid doing otherwise.

The student who saves himself the cost of a membership in the Hospital Association; who makes provision for his health secondary to his effort to obtain an education is often like the man who pays for a car by not buying oil, and fails to arrive because his machine burns out. Of the 137 Illini who have died of tuberculosis since the class of 1916, death has occurred on an average of 4.21 years after leaving the University. Obviously learning, whether in high school or college, is inadequate which does not bring an appreciation of relative values.

A student who saves himself \$3 to \$5 a semester by not joining the Hospital Association with the expectation of remaining at his lodging house or fraternity when sick frequently infects others, who as a result, become ill and must pay for their own hospital and medical care. Thus, he dulls his sense of social responsibility and gets his education at the expense and at the temporary or permanent loss of the health of others--hardly a commendable standard of conduct in an age of "Keeping Fit."

Contagious Disease McKinley Hospital admitted 457 cases of contagious disease. Of these, 360 were hospitalized for German measles; a total of 351 students, or 96.7 per cent, and 9 non-students. The cases of contagious diseases admitted to McKinley Hospital are given in the following table:

## COOPERATION WITH OTHER DEPARTMENTS

Military Science and Physical Education

(a) Permanent Classification: During the year it was necessary to assign 324 men and 188 women to individual gymnastics for special training. Because of marked physical abnormalities or organic disease, 146 students were classified as unable to take either regular physical education or military.

There were 33 students permanently excused from military because of failure to meet the minimum requirements of the

Medical Department of the Army. Five students were re-assigned to military because of improvement or correction of their physical defects.

(b) Advanced Corps Students: The Health Service administered 286 doses of typhoid vaccine and vaccinated 112 students against smallpox who were planning to attend the Reserve Officers Training Camps. In cooperating with the Army Medical Corps, 289 urinalyses were made upon candidates for advanced military training.

(c) Temporary Excuses: During the year 216 men and women students were given temporary deferment from military, physical education, or both; 12 men from military only, 84 men and 120 women from physical education only. They had undergone recent operations, or had lost so much time on account of illness that they could not complete satisfactorily the work for the semester.

Students suffering from certain forms of dermatitis, sinusitis, infection of the middle ear, or perforation of the ear drum were transferred from swimming to a form of exercise less likely to cause them trouble. A total of 44 recommendations were made to change students from one type of physical education to another or for modifications of their required exercise.

### The Personnel Bureau

The Bureau has referred students to the Health Service for a recheck of their physical condition, metabolism tests, or further determination of their acuity of vision. Forty-seven students were given telebinocular examinations. Ninety-one students were given metabolism estimates, and a number of others advised as to their health.

### INSTRUCTION IN HYGIENE

Compilation of the results of 1,965 questionnaires filled out by freshmen registered in Hygiene 1, 2, and 5 revealed that only 33 teachers of hygiene in the high schools attended by those students, gave full time instruction in health education. The greater percentage taught the subject as a "side line." Illinois is still far behind in having its teaching of hygiene and sanitation of a quality comparable to their importance to the individual and to the State.

The survey (see Appendix G) reveals, furthermore, that students who do not attend college do not receive sufficient training in high schools in regard to personal health, nutrition, sanitation, the control of communicable disease, and healthful living to meet intelligently the demands of our highly complex society. The seriousness of this situation becomes apparent when we recall that only 10 per

gent of those graduating from high school attend institutions of higher learning, and that science can only be applied to the general welfare in a democracy by support of the people. This educational deficiency assumes the aspects of a menace in a chaotic world of rapid transportation, shifting troops, demolished cities, and life in bomb shelters.

Proficiency Examination: A total of thirty-three students passed the proficiency test in hygiene and received credit in the subject. None of the students were from out of the State. The distribution by colleges of those who passed the proficiency test during the past year is given in Table 13.

Physical Education . . . . .	-
Education . . . . .	<u>1</u>
Total	33

Elementary Hygiene 1: To cooperate with the newly organized General Division of the College of Liberal Arts and Sciences in the formation of its special curriculum for selected freshmen, the regular course, Hygiene 5, meeting twice a week for one semester with two hours' credit was split into a two-semester course meeting once a week

for an hour's credit each semester. This course extended over a full year and was given to 127 students the first semester and 120 the second semester.

This arrangement seemed necessary to help the College of Liberal Arts and Sciences in its experimental program but it is distinctly not in the interest of better instruction in freshman Hygiene and Sanitation. With the course meeting only once a week, continuity is exceedingly difficult because, with the intervention of holidays, the class may meet but once in two weeks, or even three weeks. Courses conducted on this plan lose prestige, are likely to prove uninteresting to the student and discouraging to the instructor because it is necessary to so condense subject matter in order to complete each topic at a session that inadequate instruction occurs in a number of instances. This is peculiarly unfortunate in a course like Hygiene and Sanitation, which is not only essential in normal times, but may prove life-saving to students who in a few months may find themselves in the Army serving in tropical or sub-tropical climates.

Elementary Hygiene 2 and 5: In the first semester, elementary hygiene and sanitation were taught to 1,562 students, of which 1,167 were men and 395 were women. The total registration for both semesters in elementary hygiene was 3,291. There were 25 sections for the men and 10 for the women each semester.

Advanced Hygiene: The advanced course in hygiene for coaches, physical education majors, and teachers had a total registration for the year of 157 students. During the first semester the enrollment was 37 students; in the second, 120.

Hygiene X3: In cooperation with the Director of the University Extension Service, a correspondence course in hygiene has been offered, which has had a registration of twenty-nine students. The quality of the work presented by those taking it was most satisfactory. This training should better prepare them to protect themselves and their families and to function more intelligently as citizens interested in improving living conditions in their community.

#### SANITATION

Swimming Pools: Immediate attention has been given to reports which have been received concerning the conditions of the swimming pools and water supply. No colon bacilli were reported found during the year. The pools and water supply of the University have been well supervised by an able and conscientious Sanitary Engineer.

#### FIRST AID

A total of 144 first aid cabinets is being maintained in the various buildings on the campus. They are much used and are visited weekly or twice weekly, depending upon their location, to replace supplies as needed.

It has been customary for a number of years for members of the Health Service staff upon request, to attend certain University functions in order to render first aid if necessary. This service was given at the Electrical Engineering Show, the Physical Education Tournaments, Farm and Home Week Programs, and the Commencement Exercises.

In cooperation with other departments, the offices of the Health Service were also made available in emergencies to guests of the University. Its facilities were offered to those attending Farm and Home Week, 4-H Club Conventions, and short courses given by the University.

#### LABORATORY SERVICE

As a part of the routine work of the Health Service, various laboratory services were given the students and Civil Service employees. In many instances these tests were essential either in making effective the regulations of the University concerning foodhandlers or in diagnosing and controlling communicable disease. The bacteriological tests recorded herewith were largely made by the branch laboratory of the State Department of Health on specimens submitted by members of the medical staff of the Health Service. It is a pleasure to acknowledge our indebtedness to it.

## REQUESTS FOR INFORMATION

A total of 221 citizens of the State have requested information on various aspects of public health. Requests were also received for reprints of articles by

members of the department and for copies of forms used by the Health Service. Questionnaires from numerous sources have been many, varied and often quite comprehensive. This form of survey seems to be increasing in popularity.

#### THE GENERAL PRACTITIONER AND THE HEALTH SERVICE

The medical staff of the Health Service has had the most helpful cooperation of local and family physicians in caring for students. A total of 212 letters have been received concerning the physical conditions of students who are or have been patients of these doctors. From Table 16 it is seen they have made 461 certifications relative to communicable disease.

Total	<u>461</u>

The number of students admitted to local hospitals during the academic year was 3,569. Of this number, 2,899 were sent to the hospitals by local doctors, and

670 went directly from the Health Service Station. The 670 who went to the hospitals from the Health Service Station chose fifty-three different doctors to attend them while ill.

#### STUDENT DEATHS

It is with much regret that I report the death of six students during the year. Of these deaths, one was caused by an automobile accident, one died of streptococcus pneumonia, one by suicide, one by agranulocytic angina, one by accidental electrocution, and one after appendectomy.

TWENTY-FIFTH ANNUAL REPORT

APPENDIX A

## APPENDIX A

A BRIEF RECORD OF THE CREATION AND DEVELOPMENT  
OF THE HEALTH SERVICE OF THE UNIVERSITY OF ILLINOIS

The Health Service of the University of Illinois was conceived in the throes of an epidemic and brought forth in a world at war. Its quarter of a century of existence, official and actual, almost coincides with the period between the sinking of the Lusitania and the attack upon Pearl Harbor. Although there was some medical service to students and employees from February 1915, to September 1, 1916, it was not until the latter date that this University activity assumed the dignity of the name which now characterizes such work throughout the colleges and universities of the country.

An Epidemic Contributes to Progress

In February 1915, virulent scarlet fever appeared among the students. Within seventy-two hours, the first two attacked died. One of their nurses acquired the disease and promptly succumbed a few days later. The wife of the barber whose shop was in the basement of the old Y.M.C.A. building, now Illini Hall, also became infected and lost her life.

Excitement was intense; the wildest rumors flew thick and fast. "The towns are quarantined. Trains do not stop. Ten miles out they increase their speed and go through at 60 miles an hour with blasting whistles to make their next stop twelve miles away." There were even those who had heard many students had died and like Sir John Moore had been buried without a "funeral note,"

"By the struggling moonbeam's misty light,  
And the lantern dimly burning."

Telephone calls, telegrams, and letters of inquiry from anxious parents arrived in a steady stream. It became apparent that reassurance and

a sedative to calm the needless fear of students and others were imperative. A committee composed of Deans David Kinley, Eugene Davenport, and Thomas Arkle Clark met in the office of the Dean of Men at that time located on the north side of the corridor in the southeast corner of the Natural History Building. The situation was thoroughly reviewed with a representative of the Illinois State Department of Health and a statement was given to the press to the effect that everything possible was being done, and there was no cause for alarm.

An instructor in histology and physiology in the first year curriculum for premedical students was called into the conference and directed to fumigate such rooms and buildings as the Committee might deem desirable. It was recognized at the time that fumigation with formaldehyde as usually done or could be carried out in many of the laboratories with their numerous vents left much to be desired as effective disinfection. Nevertheless, it was felt that such a procedure, at least, would be a good preliminary to subsequent thorough cleaning and both impressive and reassuring.

Within a few evenings, through the fine cooperation of the Physical Plant and the able foremanship of Thomas J. ("Shorty") Fay, some three and half million cubic feet of space in classrooms, offices, laboratories, shops, and gymnasiums had been exposed to formaldehyde gas. These places were then aired, cleaned, and given as much sunlight as possible. The result was as confidence restoring as music to passengers on a storm-tossed ship. Something was being done. Those who caught a good whiff of formaldehyde on entering a building or as it escaped from windows of classrooms seemed immediately convinced that strenuous efforts were being made to combat the disease.

Fortunately, the peak of virulence of the scarlet fever had been passed in the first week of its occurrence. Students who developed the disease later had it in a milder form and in a month the epidemic had become an unhappy memory of seventeen cases, four deaths, and no serious complications.

The methods for controlling scarlet fever over a quarter of a century ago were quite different from many of those being used in the Furious Forties. Isolation, quarantine, and disinfection were the only dependable means at hand and they were often too late and inadequate. Even the cause of the disease was still in the realm of debate. The Dick test was yet to be discovered and immunization was still experimental. Antitoxin was not being manufactured and general knowledge concerning the types and behavior of streptococci was very meager.

Like all epidemics which cause severe illness, deaths, alarm, much inconvenience and expense, this one of scarlet fever was a milestone in the application of preventive medicine and sanitation to University life:

1. Illinois now held all collegiate records for speed and amount of cubic air space fumigated with formaldehyde without the interruption of instruction.
2. The engine room of the old Floriculture Building at the south end of Sixth Street had been used as a hospital and a movement had been initiated which led to the conversion of the remainder of the building and the horse stable fifty feet south of it into a reasonably well-equipped hospital of fifty-five beds. This hospital served a most useful purpose for over ten years.
3. This scarlet fever epidemic led Professor T. A. Clark, Dean of Men, to express a determination to present to the Hon. Wm B. McKinley the need of a hospital for the students and faculty of the University. The Dean was successful and this distinguished alumnus, his lifelong friend, donated funds for the erection of the main section of what is now the McKinley Memorial Hospital.
4. The urgent need of the service of a college physician to prevent and control communicable disease was clearly demonstrated.

5. It became very apparent that epidemics are fought with great difficulty unless the public understands the cause, mode of spread, and methods of prevention of disease. Thus from an unhappy experience, there were laid the foundations of two hospitals, a health service, and regular instruction in hygiene and sanitation.

When the scarlet fever epidemic was over, the part-time instructor in physiology and histology was directed by President Edmund J. James to report to the office of the Dean of Men daily from 4:00 to 6:00 P.M. "to see such students as might be referred to him by the Dean" for the rest of the second semester of 1915-16. This physician became available in the office of Mr. A. R. Warnock, the Assistant Dean of Men, for such advice as certain students might seek. During this period, he received approximately 1,000 calls from students.

#### A Foodhandler has Typhoid Fever

The second semester of 1914-15 was a period of epidemics. The last student who had had scarlet fever had hardly been released from quarantine when one of his schoolmates was found to have typhoid fever. Within ten days twelve students and three townspeople had developed the disease. From the appearance of the second case it was apparent that the one thing which all the sick had in common was eating at a certain restaurant in Urbana. A thorough inspection of the place revealed a very cooperative proprietor who had had the disease twenty years before, a rather well-kept kitchen and lunchroom, and employees who insisted they were in good health. A cook was absent from work because of severe burns of her foot caused by spilling boiling lard upon it.

As the proprietor had been serving food for a number of years and none of his patrons had been known to have had typhoid fever while eating at his restaurant, it was not believed he would prove to be a typhoid carrier. This assumption was confirmed by a negative bacteriological examination of his feces and urine. A special visit was made to the home of the disabled cook. In

response to a rap on the door, she appeared at the second story front window with the question, "What do you want?" When asked if she were ill or had been, she replied "There is nothing wrong with me except my foot and that is gradually getting better."

As all the other workers at the restaurant had been found to be apparently normal, its water supply and its sources of food and milk were thoroughly checked. Not only the dairy which supplied the milk was inspected but all the farms from which the milk came were visited, their sanitary condition noted, and the health of the members of the family of the producers ascertained. This inspection and investigation, however, was without result.

The local health officer stated that no cases of typhoid fever had been reported to him for several months. All the practicing physicians in Champaign-Urbana were contacted but none were found to have patients with typhoid fever. When all evidence to locate the source of the epidemic seemed to be unsuccessful and a thorough recheck was being made, a doctor that had been previously interviewed, telephoned to report that he had found the source of the disease. The second cook, who had been at home because of her burned foot, had become so ill that her fiance insisted upon a doctor being called. She was found to have typhoid fever. Her mother who was employed at the restaurant was stopped from working there. No other cases developed. The cook had caused fifteen cases, twelve of whom were students who had hospital and doctors' bills totaling approximately \$1,500.

With the close of the academic year, Health Service work was officially suspended for twelve months. The physician whose services had been drafted during the scarlet fever epidemic was appointed as examiner of Civil Service employees in the summer of 1915. He opened his office in the southeast room on the second floor of the dwelling at 1205 West Springfield Avenue with equipment consisting of a scale and a measuring rod. He provided his own stethoscope,

thermometer, sphygmomanometer, and tape. His office hours were from three to five daily, except Saturday.

### The Formal Beginning of the Health Service

During 1915-16, students were seen only occasionally for medical advice at the special request of the Dean of Men, but in the summer of 1916 the Health Service was created and the examiner appointed health officer as of September 1. In the late fall, an office was equipped for him in the southwest corner of the first floor of the Men's Old Gymnasium. At this location students and employees were seen in ever increasing numbers until the dwelling at Green and Wright Streets, which had been the residence of the President of the University, was converted into a Health Service Station.

In the fall of 1916, a somewhat comprehensive study was made of the present and future needs of a Health Service adequate for the students of a large University. On February 17, 1917, the late Mr. Kendrick C. Babcock, formerly Dean of the College of Liberal Arts and Sciences and first Provost of the University, transmitted its results and recommendations to President Edmund J. James with the following comment.

"The accompanying report of Dr. J. H. Beard on 'A Proposed Health Service for the University of Illinois' is transmitted at his request with my strong endorsement. This should have been sent on several days ago. I understood that it was a copy for my information and not the original for transmission to you.

"This report is the result of a careful investigation of the practice of other institutions, made by Dr. Beard and summarized in the attached chart, and a judicious survey of the need and opportunities here at Illinois. Dr. Beard has had several conferences with me on the matter, as well as with Dean Clark and others. The report in its present form seems to me at once comprehensive and concise. The provisions and arrangements for examination, dispensary treatment, hospital for medical, surgical, contagious, and isolation cases, sanitary supervision of the University community, and the conduct of investigation of problems arising from these different branches of the Health Service, as well as direct instruction to students, have been carefully considered. In my judgment the provisions recommended are sufficiently elaborated to provide for a much larger student body than we now have. For example a hospital provision of fifty beds, if judged by the experience of the University of California as described

in the valuable and interesting paper by Dr. Legge which I have attached to the report, would be larger than the immediate needs of our student community. If a semester fee of \$2.50 or \$3.00 for the Health Service can be charged, I believe the Service, once established and well equipped, would be self-supporting save for the salary of the Director and for charges for major operations in surgery where the assistance of outside help would be necessary. Even in the last group of cases it might be possible to arrange for regular consultations either here or in Chicago with the experts on the staff of the College of Medicine without involving the students in the mesh of high professional charges.

"The nature of the service to be rendered by the dispensary or clinical division of the infirmary makes it desirable to locate the new building where it will be readily accessible to the great mass of the student population. Merely as a hospital, it might go out on the Augustus tract; as an agency of the Health Service it ought to be within four or five blocks of Green Street and Burrill Avenue if possible to find a site which would be at once spacious enough and quiet enough for the combination of purposes under consideration."

### A UNIVERSITY HEALTH SERVICE

"An efficient University Health Service and a great school of preventive medicine are complements. The former creates public sentiment by teaching future community leaders to know and to appreciate the relation of good health to efficiency, economy, happiness, and personal success; the latter trains experts for leadership in hygiene and sanitation. Limited will be the success of one without the other. A Health Service to meet properly its obligation to the University and to society should be conservatively advanced, and to be adequate must have a four-fold function:

1. The prevention of disease.
2. Means for caring for the sick.
3. Education.
4. Investigation.

### PREVENTION OF DISEASE

"1. A preliminary examination of all freshmen and new students by competent medical examiners is the most essential part of any system of prevention of disease among students.

- a. For the detection of disease in its incipency and the giving of treatment when the greatest number of cures are possible.
- b. For the discovery of communicable diseases and their early isolation and cure.
- c. For the complete co-operation between the Department of Physical Training and the Health Service.

- 38
- d. For the detection of defects of vision, or hearing, or abnormalities of the nose and throat, and for provision for their early treatment by specialists.
  - e. For advice as to need of dental service.
  - f. There should be not only a thorough 'follow up' system to ascertain whether the student has been effectively treated, but there should be a 'follow back' system that would definitely determine how it is possible for a student to pass through high school and come to the University with a vision of only 4/20 and uncorrected, with untreated discharging ears, deforming adenoids or neglected tuberculous glands of the neck. The records of a University Health Service will always show the efficiency of the medical supervision of schools of the State.

"2. Employees.

- a. Physical examination of all Civil Service employees. (Now being done)
- b. All Civil Service employees be required to be vaccinated against smallpox. (Now being done)
- c. All Civil Service employees who come in contact with the food or milk products of the University be required to undergo an examination to exclude them from being typhoid carriers. (Now being done)
- d. All Civil Service employees who handle the food or milk products of the University be required to be inoculated against typhoid fever. (Now being done)
- e. Greater effort should be made to adapt the work to the physical condition of the employees. (Now being done in a small way)
- f. An employee should be required to undergo a physical examination when he does not seem able to do his work or there is evidence that he may have an infectious disease.

"3. Faculty.

- a. Members of the faculty should be required to report infectious diseases in their families or on their premises. (Now being done)
- b. All faculty members who come in contact with food or milk products of the University should be required to fill out a blank stating whether they have had

typhoid fever, have been associated with typhoid patients, or have been exposed to an infectious disease within three weeks before beginning to handle the food or milk products. (Now being done)

"4. Systematic Inspection of Lodging Houses as to:

- a. Ventilation, bath and toilet facilities, heating and lighting, general appearance of comfort, cleanliness, etc.
- b. Stables, privies, piggeries, chicken coops, wells, garbage disposal, etc.
- c. Protection against fire.
- d. The houses inspected should be classified as 'Accredited' and 'Unaccredited' and the list of classification should be available for the information of the students.

"5. Eating Places Should be Systematically Inspected.

- a. All students of the University who cook, serve food, or wash dishes should be required to furnish a certificate that they have no transmissible disease and are not typhoid carriers.
- b. That student organizations be encouraged to insist that all proprietors of lunch-rooms catering to student patronage should show evidence that their help other than students are not 'typhoid carriers' and are not suffering from a transmissible disease.
- c. That the Health Service of the University should permit proprietors of lunch-rooms at which students eat regularly to have their help other than students tested against being typhoid carriers without cost. (This is open to some objections, but in the light of experience of other schools its adoption would save lives and avoid much illness.)

"6. Swimming Pools.

Swimming pools may readily become a medium for the transmission of typhoid fever and dysentery, respiratory diseases, infections of the ear and eye, and according to some sanitarians, of venereal diseases. I should recommend that the Director of the State Water Survey be requested to assign one of his assistants to assume charge of the sanitation of the swimming pools permanently, and that the assistant shall make weekly examinations of the sanitary condition of the pools and send the Health Service of the University a result of his findings.

## "7. Immunization.

- a. That the unvaccinated student be vaccinated, if he submits a request in writing and is twenty-one years old, or if he is less than twenty-one years old, provided his request is endorsed by his parent or guardian.
  1. The value of vaccination against smallpox is unquestioned by scientific men.
  2. If the University is to avoid an epidemic of smallpox, the number of unvaccinated students must be kept at a minimum.
  3. The cost of vaccination is small.
- b. That the student be inoculated against typhoid fever, if he submits a request in writing and is twenty-one years old, or if he is less than twenty-one years old, provided his request is endorsed by his parent or guardian.
  1. The great value of typhoid inoculation as a means of prevention is well established.
  2. The Illinois State Board of Health, recognizing the great value of typhoid inoculation as a preventive measure, and at the cost of the State, furnishes the vaccine free of charge.
  3. The self-supporting student working his way and many times with little choice as to the sanitary conditions of the place at which he works is unable to enjoy this protection offered by the State unless he pays a physician \$5-\$10.
  4. As the Military Training at the University is extended and the students go to rifle ranges, encampments, and on marches, the danger from typhoid fever is increased.

## PHYSICAL EDUCATION.

### "1. Physical Training.

It is obvious that four years of life in a University should mean for the average young man or young woman a distinct gain in physical efficiency. The flat chests, the slight musculature, the abnormal shoulders, and the underweight for age and height, in men who have completed the period of physical training at the University are conclusive evidence that many of the students at the University of Illinois have not obtained the physical benefit they should receive during their four years at school.

We should, therefore, recommend:

- a. That, beginning with September, 1917, a student's physical proficiency be determined by definite measurements of development and strength, rather than by exercise for an hour twice a week for two semesters.
- b. That all students who on entrance show by physical examination normal strength and development for their age be excused from physical training.
- c. That all students who are below the normal development and strength for their age be required to pursue a course of physical training until their development and strength are normal.
- d. That examinations be held during the month of May of each year for subnormal students who may desire to qualify as proficient in physical training.
- e. That the Department of Physical Training make provision for the physical education of the student who may be unable, on account of some physical defect, to take the regular course. Such a course should not only include general exercise, but it should be given with a view of correcting the physical defect of the individual student.
- f. As swimming may be life saving, as well as an excellent form of exercise, the present requirements should be retained.

"2. Athletics.

In athletics the danger of over-doing when carried out along lines of extreme specialization makes it advisable that all athletes should have medical supervision. By such care it would be possible to keep out of strenuous competitive events those unequal to the strain, but who under ordinary circumstances would be able to keep up athletic work with benefit to themselves.

- a. Men desiring an athletic career should be carefully examined to exclude unsuspected heart disease, dangerous hernias, kidney disease, or incipient tuberculosis.
- b. During training it would be of advantage both to the health of the athlete and to the efficiency of his team, if his physical condition was carefully followed in reference to physical measurements, condition of heart, blood pressure, lung capacity, weight, function of kidneys, etc.

"Practically all participants in major athletics have physiologically hypertrophied hearts and muscles--hearts and muscles that are likely to undergo detrimental retrogressive changes. For this reason, the athlete should be encouraged to engage in some sport or form of exercise between seasons which he would likely pursue beyond his university days, since he must consider the great reaction that will follow the change from the physical tension of strenuous athletic competition to the physical passivity of a sedentary occupation.

### CARE OF THE SICK.

"To take care of the sick a building will be needed. It must have wards for men and for women, a ward with separate rooms for the isolation of those that might be ill with various infectious diseases, and a detention ward so arranged as to take care of those exposed to contagious diseases. A 'group building' could be used more effectively and economically than one large structure.

#### "1. The building should provide for:

- a. A University Hospital of not less than fifty beds, to be divided as follows:
  1. Separate wards for men and women.
  2. Isolation wards for infectious diseases.
  3. Private rooms for the isolation of the very ill.
- b. A Detention Ward for those exposed to infectious diseases, an attractive place, where the students would be willing to go and to remain until it was safe for them to mingle with other students.
- c. Dispensary for the treatment of local injuries and minor ailments.
- d. Examination rooms.
- e. An Operating Room to meet the needs of the modern surgeon who might be called in cases of injury or in emergency cases of illness.
- f. An Actinographic Room for medical and surgical diagnosis.
- g. Diet kitchen.
- h. Clinical Laboratory for the examination of urines."

### World War I Delays Health Service Development

Before "A Proposed Health Service for the University of Illinois" could be adopted, the United States entered World War I on April 6, 1917, and the University put its facilities at the disposal of the Federal Government.

In the spring of 1918, however, men students desiring a complete physical examination, were offered an opportunity to get one. With the assistance of certain local physicians, a total of 404 students were examined in three days without interference with their class work.

As expected, the examination revealed that the physical condition of those examined did not differ materially from draftees in the number and type of their defects. Defective vision (much of it uncorrected), partial deafness, carious and missing teeth, diseased tonsils, flat feet, hernias, cardiac lesions, underweight, and postural defects were found to be common and in need of attention from the viewpoint of their prevention in future classes and their correction as far as possible in those already in college. A large per cent (97.5) were not vaccinated against smallpox.

In 1919 the Board of Trustees passed a regulation requiring all new students to be examined on matriculation. This requirement, however, was not enforced immediately because all men students matriculating in the University in the fall of 1918 were prospective inductees of either the Student Army Training Corps or the Student Navy Training Corps.

Members of the Medical Corps of the Army and Navy were to be assigned to the University to examine the students in September 1918. The day before the examinations were to begin, President James was notified that the Army and Navy did not have surgeons available for such an assignment; he was authorized to employ contract surgeons for the purpose. As a result of this direction, the local physicians who had assisted in the optional examination in the spring of 1918 were appointed contract surgeons to make the examinations for the Army; the Navy sent a member of its medical staff to the Campus from Peoria to conduct the examinations for it.

### Influenza Pandemic

The physical examinations were conducted for the Army with as much dispatch as the greatly reduced number of physicians remaining in Champaign-Urbana, classes, and the military training of the S.A.T.C. and S.M.T.C. would permit. By the last week of September all of the men students had been examined with the exception of about fifty who had not registered at the regular time.

September 30, 1918 marks a milestone in the epidemiological history of student health at Illinois, because influenza which had been reported in many places throughout the world and in the United States made its first appearance in the student body. During the next six weeks over 2000 students had the disease. Seventy were known to have acquired pneumonia and nine died, a low mortality rate for the period antedating typing, serum treatment and the sulfonamides.

The first "wave" of the pandemic presented some striking features. Women students were attacked much less frequently than men, the ratio being about 1 to 3. They developed pneumonia less often and none of them died. The disease spread with less rapidity in students housed in small groups and on the whole appeared less virulent. This may have had some bearing upon the incidence and mildness in women since they lived in smaller groups than the men. This fact may also have had some effect upon the spread of virulent secondary invaders and upon the amount of sleep, fatigue, and resistance of those attacked.

The pandemic extended almost explosively. Within seventy-two hours, students were being hospitalized at the rate of one hundred a day. To meet this demand, the University had only the hospital on the South Campus of fifty-five beds. All available space was quickly filled, and the improvisation of

hospitals was an immediate and imperative need. College Hall was promptly converted into a hospital, equipment obtained locally or by telephone and trucked from distant centers of supply. The dance hall immediately east of College Hall was used for convalescents. The Beta Theta Pi fraternity at 202 East Daniel Street and Osborne Hall (now the Chi Omega sorority) were requisitioned for hospital purposes. The gymnasium in the Woman's Building was also prepared as a ward to care for women who acquired influenza. The total facilities, including that of the hospital, provided approximately 450 beds for the emergency.

To combat a rapidly developing pandemic, various groups had to be found to assume special duties. The Department of Physical Education, ably directed by Mr. George Huff, volunteered to procure, prepare, and equip the buildings selected for hospital purposes with beds, mattresses, linen, etc., and to see that they were ready when needed. Mr. Ralph Jones, the basketball coach and an athletic scout of experience, was assigned the duty of locating and hiring such necessary personnel as cooks, maids, dishwashers, and nurses.

Dean Clark, in addition to the many demands of his office, informed, consoled, advised, and generally looked after excited, anxious and distressed parents. He obtained the assistance of many faculty, townsmen and women who were willing, without thought of themselves, to risk acquiring influenza to care for sick students. The Business Office was taxed to its capacity to obtain equipment at once, to insure its delivery, to provide food and medical supplies, and to keep an account of services being rendered. A number of local citizens, outstandingly Mr. Isaac Kaufman, generously provided transportation for physicians. Mr. Stanley Kaufman, his son, who was then a member of the S.A.T.C., rendered a most valuable service as a chauffeur of his father's car in transporting nurses and doctors from hospital to hospital or from their lodging houses to the hospitals.

Many who volunteered became ill of influenza in a few days after reporting for duty and had to be cared for in the hospital or in their homes. Their spirit and courage were beyond praise. Their attitude was well expressed by Miss Ella Crawford, a citizen of Urbana, who had offered her services to assist in nursing ill students. When asked if she were afraid of getting influenza, she replied, "If I have it, I can get over it," both of which she did.

The nurses available locally were soon overwhelmed either by work or influenza. A great many usually available were in military service, and the demand for those that remained was so great that it was impossible for them to do more than partly meet it. Mr. Ralph Jones and Mr. Orville Davis, then head of the local Red Cross, visited near-by towns and telegraphed many nursing agencies in distant cities to procure nurses. They succeeded in getting eight or ten from Bloomington, Peoria, Danville, and Decatur. Unfortunately, most of them came down with influenza three or four days after their arrival for duty and thus increased the patients in the hospital to be nursed.

Luckily, most of the cases in the first "wave" of influenza were mild, did not require a great deal of medical care or nursing, and could be released from the hospital in four to six days. Patients were usually kept in bed in the hospital until their temperatures had been normal for twenty-four hours and then carefully removed to the convalescent ward and kept two days more to reduce to the minimum the possibility of recurrences or of complications. If they continued to improve, they were then discharged and taken to their lodging houses.

In dealing with influenza in 1918, the most valuable procedure was early diagnosis of the disease, getting the patient to bed, keeping him warm and giving him symptomatic treatment. This reduced the likelihood of pneumonia.

to a minimum and did the maximum to insure an uneventful recovery. The low death rate and relatively few complications proved the soundness of such a program.

To insure the detection of the disease in its incipency, a student in each lodging house was designated as a captain in charge of it and was instructed to report any of his associates who began to show any sign of illness. When the reports were made a physician went to the house in an ambulance and examined the suspect. If there were any reason to suppose he was developing the disease, he was warmly wrapped, put in the ambulance and taken to a hospital. In the case of women students, an ambulance containing a doctor and a nurse went to the house, examined the patients and took them to the hospital.

By the middle of November the first "wave" of influenza was history. The number of patients had been reduced to the capacity of the hospital on the South Campus. It was evident a second "wave" was in the making, so arrangement was made to use Busey Hall as an emergency hospital. About November 25, the cases of influenza began to increase again, and during the next month some three hundred cases occurred. This time the complications were more severe. Thirty-six patients were known to have had pneumonia; of these, nine died, a mortality rate about normal for that period of medical knowledge. A part of this increased mortality was probably caused by the tendency of secondary invaders of the respiratory tract to become more virulent with the approach of winter. In some instances, influenza assumed a severe form in students who had been fatigued in intensive military training. Their resistance seemed to have been reduced. Another factor that may have had some significance was the housing of students in larger quarters, notably in those constructed in the Armory. These students had common food supplies, eating and drinking utensils, etc. Such a situation probably made it easier both for the virus of influenza and for virulent secondary invaders to pass from one individual to another by both direct and indirect contact.

When one looks on the pandemic of influenza twenty-five years after its occurrence, one is struck by the tremendous amount of literature that has accumulated in regard to it, and the fewness of the facts that were gleaned which would be really useful to combat such an epidemic today. Early diagnosis, getting the patient to bed quickly and keeping him warm are still the best means to insure a prompt cure and to reduce the likelihood of complications. Happily, the introduction of typing of pneumococci and the discovery of the great value of the various members of the sulfonamide group are tremendous progress in fighting secondary pneumonia, the principal cause of death in influenza.

### Health Program Begins

During the fall of 1919 plans of the Health Service, which had been delayed on account of the war, were brought to materialization. The Department was moved into the President's old house which had been vacated by the Y.M.C.A. This building provided ample room and many conveniences it had not previously enjoyed. The location at Wright and Green Streets was almost in the center of student activity.

In August of 1919 Dr. Gertrude E. Moulton, the former head of the Department of Physical Education for women and a recent graduate of the Illinois College of Medicine, was appointed to the Health Service staff to be in direct charge of its Division for Women. Dr. Max Lambert, who was also a graduate of the Illinois College of Medicine, joined its staff as a part-time assistant to the University Health Officer.

With the beginning of school, the regulation passed by the Board of Trustees on March 18, 1918, requiring all new students to be examined on matriculation, was put into effect with the assistance of local physicians and several women doctors from Chicago to help in the examination of women students. At this time a total of 3,214 students were examined, of which 850 were women and 2,364, men. The findings in the case of men were similar to those of the draft noted in individuals of the age of college freshmen.

### Health Education

A formal course in hygiene had never been given at the University of Illinois. Freshmen, however, were required to attend certain lectures dealing with health at the beginning of the first semester. Originally they were given by an instructor in physical education, but for a number of years preceding the establishment of the Health Service three or four lectures in personal hygiene, etiquette, and University regulations were given by Professor T. A. Clark, Dean of Men. He had obtained permission from the Department of Physical Education to use one hour a week for three or four weeks of its class periods for freshmen for this purpose. The women students received similar talks from the Dean of Women who also utilized time allotted to her by the Department of Physical Education for Women.

In 1916 the Physical Education Department permitted Dean Clark to extend his lectures from four to seven periods at the commencement of the first semester. He invited the recently appointed University Health Officer to lecture to freshmen men on hygiene, and specified that the subject matter should deal with venereal disease. By this arrangement the freshmen were exposed to a short composite course called hygiene which consisted of two lectures on personal hygiene, one on manners, one on University regulations, and three on venereal disease. Such lectures were a distinct advance over no instruction in health education, but obviously were only a very modest sample of what a course in hygiene should be.

No text book or outside reading was required. The men students had to hand in notebooks; in passing the course, the lack of absences was a highly important consideration. The women, however, were required by the Dean of Women to read a text entitled The Woman Citizen in which they learned of the duties of women as prospective voters, members of juries, etc. This was clearly not hygiene, but preparation to meet the anticipated responsibilities of women on the ratification of the Susan B. Anthony, or Nineteenth, Amendment.

After a year or two of discussion, hygiene was finally extended to include lectures for one hour a week for a semester, four periods of which were to be used by the Dean of Men and the Dean of Women to make such contacts and to give men and women such information as might be desirable for students on entering the University.

Lectures were given to groups so large that it was not uncommon to exceed the seating capacity of the classrooms assigned for the purpose. Even in Room 228 Natural History students often had to sit on the window ledges, and some sat on the radiators when their temperature would permit. This type of instruction was better than nothing, but not a great deal. In 1922 the course was extended to one hour for two semesters. Over-crowding of sections, the impossibility of giving attention to the individual student, and the lateness of the hour in the afternoon at which the lectures were held make the course in hygiene unpopular with the students and even more so with those attempting to teach it. Continuity was very poor since with vacation periods, class intervals were commonly two weeks and sometimes three or even four weeks.

With the phenomenal advances in preventive medicine and sanitation, demand for instruction in them increased throughout the country. In other universities, as well as at Illinois, the feeling grew that all instruction in an institution of higher learning should be given under conditions which experience had shown were essential for successful teaching. In 1924 the unwieldy sections in hygiene were discontinued, and sections were formed of the size considered desirable in the University for other subjects. Enough members were added to the Health Service staff to make it possible to give instruction in hygiene under satisfactory conditions.

#### Objectives of the Health Service Have Been Well Defined

The realization of a University Health Service as outlined on February 17, 1917 had been the objective for student health since that date.

The program for applying the principles of preventive medicine and sanitation to a college community has taken seven general directions.

### 1. A Healthful Environment

The provision of a safe, healthful environment is necessary to prevent epidemics, to eradicate fire hazards, and to insure against avoidable accidents. Surroundings must be clean and attractive; illumination, both artificial and natural, must be adequate; and proper ventilation must be assured. A safe water supply, proper disposal of sewage, wholesome food, and a good, clean milk supply are essentials of a healthful environment.

First Aid must be available in cases of illness or accidents. Cabinets with supplies for giving it must be at hand in strategic locations where accidents may occur. Proper facilities must be provided to protect those who handle injurious substances, use lethal gases or come in contact with plants or animals capable of causing disease.

### 2. Medical Examinations

In accord with the recommendation creating a Health Service, the Board of Trustees of the University passed a regulation on March 12, 1918 requiring a physical examination of all students entering the University for the first time. The purpose of an examination is to provide an inventory of the physical and mental health of students and to initiate the correction, cure or alleviation of their defects. The information obtained through it is also essential in the classification of students for military service and physical education. In ascertaining whether or not students have physical defects, the risk is avoided of requiring compulsory exercise without the adoption of proper safeguards. By requiring a medical examination of each student on matriculation, it is possible to avoid the futile procedure of giving men military training who would later be rejected for military service--thus there is a saving in both effort and money.

A medical examination is recognized as an excellent means of health education. It makes the student aware of his defects and abnormalities which need attention, and offers a chance to refer him to competent physicians and specialists for treatment. The examination reveals to him the many benefits to be derived from a periodic check of his physical and mental condition. This knowledge can prove of great help to him in keeping physically fit and at his highest efficiency. A medical examination is of tremendous importance in making an early diagnosis and adopting measures for the prompt control of communicable disease. By having the student correct his physical handicaps and functional abnormalities at his

earliest opportunity in his college career, he is materially assisted in making the most of the facilities available for his education. It prevents students from carrying a study schedule which threatens, if it does not actually precipitate, a physical or mental breakdown.

In September 1930, at the direction of the president, all pupils entering the University High School were required to take a physical examination. This requirement gave them the benefit of a physical inventory and provided the administrators of the High School with the necessary information to assign their pupils to classes in physical education and to modify their scholastic schedules when necessary on account of physical handicaps.

From its beginning the Health Service has examined Civil Service employees to insure that they are able to do the work for which they are applying and to give them a chance to seek medical treatment if needed. Such examinations also give the University information which is essential in the case of accidents involving loss of time from work or requiring compensation.

On the recommendation of the president of the University in July 1915, with the endorsement of the Director of the State Department of Health, and the approval of the State Civil Service Commission, successful vaccination against smallpox was made a part of the regular medical examination of all employees. In May 1916, a regulation was passed by the Board of Trustees requiring all employees coming in contact with food distributed by the University to be immunized against typhoid fever as well as smallpox and to undergo such laboratory examinations as will discover and exclude disease carriers from handling food.

To protect the public, the driver, and University property, the Board of Trustees, in March 1928, approved a regulation requiring all drivers of University cars to be examined with special reference to acuity of vision, color sensation, acuteness of hearing, condition of their reflexes and physical ability to operate a car at an ordinary rate of speed.

By the direction of the president, in May 1936 a medical examination was provided for all students who were to become "educational internes"; that is, for those who intended to spend considerable time in practice teaching in certain of the large high schools of the State. The purpose of this examination was to insure that graduates certified to certain high schools would be physically able to perform their duties, were free from communicable disease, had no defects which might render their success doubtful, and were immunized against smallpox, typhoid fever, and diphtheria.

During summer sessions, the college of Education planned to use pre-school children in connection with instruction of prospective teachers. Bringing together such children highly susceptible to certain communicable diseases involved responsibility, and made daily medical supervision of them imperative. Therefore, in June 1936 the President of the University directed that the Health Service provide such daily inspection.

At the request of the director of athletics, and with the approval of the president, all students wishing to participate in major athletics are required to take a physical examination to reduce the risk of the unfit participating in strenuous sports, and to protect the Athletic Association against unwarranted claims. To this end all students desiring to participate in athletics are examined each semester; those wishing to engage in football, basketball, and wrestling are examined before participating in each of these sports. The same procedure has been applied also to those engaging in intramural sports. The classification of those for intramural sports, however, is modified to insure that each student can have an opportunity to enjoy sports within his ability. Students are grouped according to whether they are able to engage in mild, semi-strenuous, or strenuous physical activity.

For a number of years the University had placed certain restrictions on the use of automobiles by students. In August 1936, to insure greater safety to the student himself, to the public, and to property, the President of the University directed that all student drivers who wished to obtain a permit to use motor vehicles must show that they are physically and neurologically able to drive a car. Students, therefore, like users of University cars, are given a complete examination before being given a motor vehicle permit.

### 3. First Aid in Illness and Accident

In 1916 the University approved the establishment of First Aid cabinets in strategic locations throughout its buildings to provide supplies and equipment essential to the prompt rendering of First Aid. The articles supplied to the cabinets are those which represent the consensus of leaders in industrial surgery--the object being to provide all the items necessary for the efficient rendering of First Aid preliminary to seeking medical attention, but not supplying materials or drugs which might prove harmful to the injured in case the person rendering First Aid was inclined to exceed his training and experience.

By direction of the president on June 29, 1928, in case of injury, First Aid was provided for faculty members who suffered accidents in the line of duty as well as for

students and employees. The purpose of this provision is to reduce infection to the minimum, prevent complications, and protect life.

The provision of dispensary service for cases of illness and accident makes it possible to ascertain the occurrence of communicable disease at the earliest opportunity. It also decreases the likelihood of minor injuries assuming serious aspects. By this arrangement students are seen early and quickly referred to competent physicians and specialists when necessary. Early diagnosis makes prompt hospitalization possible, which in turn does much to reduce the severity and duration of illness and injury, and the loss of time from the classroom.

#### 4. Prevention and Control of Communicable Disease

It is the duty of the Health Officer, who is Director of the Health Service, to use every practicable means to prevent and control communicable disease among students, faculty, and employees. This rule not only makes prevention of unnecessary illness and deaths obligatory, but it is based upon the sound economics of keeping the maximum number of students in the classroom by the reduction of absences from preventable disease.

The Health Service consistently and continually promotes immunization against smallpox and typhoid fever by conducting a program of education. Its staff has also immunized against diphtheria, scarlet fever, typhus fever, Rocky Mountain spotted fever, Asiatic cholera, and yellow fever. Immunization for the latter diseases are confined to those individuals who for valid reasons have to visit localities where they are occurring.

Every effort has been made through the years to diagnose communicable disease in its incipiency to insure prompt isolation and quarantine, where required, and to see that the sick receive treatment at the earliest opportunity.

With the approval of the Illinois State Department of Public Health, modified quarantine has been made possible and contacts with communicable disease have been given daily inspection and permitted to attend school. This arrangement saves students from the loss of thousands of classroom hours without endangering any of their associates.

#### 5. Promotion of Mental Health

It has been recognized from the beginning of the Health Service that students need not only highly efficient bodies, but sound minds and wholesome emotions. Efforts are made at the time of the physical examination to detect students who are emotionally unstable or give evidence of being maladjusted.

This quest is continued through personal questionnaires in hygiene, and conferences concerning the findings on the student's medical record made on matriculation. By frequent contacts and follow-up students are helped to adapt themselves to their surroundings and to achieve satisfaction in their work.

## 6. Health Education

As the functions of the Health Service at Illinois are preventive and educational rather than therapeutic, it tries to take advantage of every opportunity to stimulate and to encourage students to acquire good health habits and to adopt an attitude towards personal and community health which will carry over into life and prove an advantage to them, their families, their communities, and the Nation.

Emphasis is placed on the promotion and attainment of good physical health, mental toughness to withstand the strenuousness of modern life, moral responsibility, and social vigor. Through education in community health, effort is made to lay the foundation for the student to participate intelligently in the enterprises for the welfare of the community in which he lives.

## 7. Health for Teacher and Other Personnel

In institutions of higher learning as well as primary and secondary schools, it is of paramount importance that the health of teachers and other personnel should be of such a grade as to insure that they will not become a source of disease for pupils or students, but will possess the vigor essential to pursue their work effectively and to set an example of vitality and accomplishment which will be a wholesome influence upon their associates and those under their direction.

Hazel .....	11	6	17
Brown .....	6	14	20
Black .....	1	---	1
Vision abnormal without glasses			
Both eyes .....	6	6	12
Right eye (O.D.) .....	3	4	7
Left eye (O.S.) .....	2	3	5
Corrected with glasses .....	2	2	4
Colorblind .....	---	---	---

1. The first part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

2. The second part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

3. The third part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

4. The fourth part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

5. The fifth part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

6. The sixth part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

7. The seventh part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

8. The eighth part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

9. The ninth part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

10. The tenth part of the document is a list of names and addresses, which appears to be a directory or a list of subscribers. The names are written in a cursive script, and the addresses are listed below them.

1. The first part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

2. The second part of the document is a table with two columns: Name and Address. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

3. The third part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

## CIVIL SERVICE EXAMINATIONS

	<u>Men</u>	<u>Women</u>	<u>Total</u>
Total number examined.....	286	86	372
Married.....	209	41	250
Widower, widow.....	8	24	32
Single.....	69	21	90
Age			
Under 20.....	23	6	29
20-29 years....	95	14	109
30-39 years.....	74	16	90
40-49 years.....	49	35	84
50 years and over.....	45	15	60
Inheritable diseases			
Tuberculosis.....	17	6	23
Cancer.....	30	15	45
Neurasthenia.....	--	1	1
Epilepsy.....	--	--	--
Others.....	1	--	1
Birthplace			
Illinois.....	211	58	269
Elsewhere.....	75	28	103
Injuries			
Head.....	14	2	16
Chest.....	11	--	11
Abdomen.....	4	--	4
Arm.....	49	3	52
Leg.....	21	4	25
Others.....	7	2	9
Operations			
Head			
Tonsils.....	65	24	89
Adenoids.....	35	6	41
Others.....	1	4	5
Chest.....	--	--	--
Abdomen.....	34	18	52
Circumcision.....	9	--	9
Others.....	10	20	30
Vaccinations			
Typhoid fever.....	34	18	52
Smallpox.....	259	70	329
Age of vaccination scar			
Under 10 years.....	121	21	142
10-20 years.....	81	12	93
Over 20 years.....	57	37	94
Sleep			
Under 6 hours.....	--	--	--
6-7 hours.....	42	8	50
8-9 hours.....	225	76	301
10 hours and over.....	19	2	21

	<u>Men</u>	<u>Women</u>	<u>Total</u>
Habits			
Tea.....	53	34	87
Coffee.....	229	69	298
Tobacco.....	226	7	233
Alcohol.....	50	1	51
Drugs.....	--	--	--
None of the above.....	21	11	32
Diseases Had			
Measles.....	249	81	330
Rubella.....	4	34	38
Mumps.....	207	58	265
Chickenpox.....	139	67	206
Whooping cough.....	154	65	219
Scarlet fever.....	35	14	49
Typhoid fever.....	19	4	23
Diphtheria.....	8	8	16
Meningitis.....	--	1	1
Malaria.....	5	1	6
Smallpox.....	22	2	24
Pneumonia.....	37	11	48
Asthma.....	3	3	6
Pleurisy.....	7	4	11
Rheumatism.....	6	7	13
Tonsillitis.....	36	32	68
Chorea.....	--	1	1
Influenza.....	56	42	98
Otitis media.....	--	3	3
Gonorrhea.....	9	--	9
Syphilis.....	2	--	2
Chancroid.....	--	--	--
Constipation.....	2	17	19
Dysentery.....	--	--	--
Appendicitis.....	25	15	40

## RECAPITULATION

Pharyngitis .....	1930
Mycosis .....	939
Coryza .....	724
Ceruminosis .....	544
Rhinitis .....	514
Furunculosis .....	365
Dermatitis .....	262
Verruca .....	257
Acne .....	232
Sinusitis .....	185
Bronchitis .....	180
Tonsillitis .....	156
Conjunctivitis .....	152
Myositis .....	141
Tinea .....	135
Stomatitis .....	125
Vaccinia .....	106
Painful .....	95
Hordeolum .....	89
Underweight .....	87
Appendicitis .....	84
Cyst .....	83
Adenitis .....	80
Herpes .....	75
Impetigo .....	73
Otitis .....	73
Wound .....	73
Headache .....	70
Cancrum oris .....	69
La grippe .....	69
Fatigue .....	68
Dysmenorrhea .....	67
Laryngitis .....	66
Hay fever .....	65
Gastritis .....	62
Bites .....	61
Pustule .....	60
Hemorrhoids .....	58
Gingivitis .....	53
Constipation .....	53
Indigestion .....	53
Toothache (Odontalgia) .....	52
Bursitis .....	51
Flatfoot .....	51
Irritation .....	44
Arthritis .....	44
Abdominal pain .....	42
Ingrown toe nail .....	41
Deviation, nasal septum .....	41
Albuminuria .....	39
Varicose veins .....	39

Enteritis.....	38
Cellulitis.....	37
Hernia.....	36
Allergy.....	35
Clavus.....	35
Neuritis.....	33
Urticaria.....	33
Cough.....	32
Pleurisy.....	32
Rubella.....	31
Angina.....	30
Ulcer.....	29
Paronychia.....	28
Overweight.....	26
Pediculosis.....	26
Callosity.....	26
Blepharitis.....	25
Insomnia.....	25
Ureitis.....	25
Colitis.....	24
Metatarsalgia.....	23
Scabies.....	23
Abscess.....	22
Asthma.....	22
Diarrhea.....	22
Epistaxis.....	22
Gastroenteritis.....	21
Lumbago.....	21
Pityriasis.....	21
Malaise.....	20
Sore throat.....	20
Tenosynovitis.....	18
Neurosis.....	17
Torticollis.....	16
Eczema.....	15
Edema.....	15
Menorrhagia.....	15
Inflammation.....	14
Pruritus.....	14
Deafness.....	13
Fissure.....	13
Migraine.....	13
Nervousness.....	13
Poisoning.....	13
Tachycardia.....	13
Varicocele.....	13
Swollen.....	11
Caries.....	10
Hypothyroidism.....	10
Urethritis.....	10

## NINE CASES:

Ganglion, influenza, neuralgia, otalgia.

## EIGHT CASES:

Fainting, hemorrhage, mumps, myalgia, psoriasis.

## SEVEN CASES:

Bromidrosis, hyperhidrosis, neurasthenia, phimosis.

## SIX CASES:

Epidermophytosis, rheumatism, vertigo, bunion, epidermitis, hematoma, myopia, obstruction, eustachian tubes, rales.

## FIVE CASES:

Ecchymosis, erythema, folliculitis, tracheitis.

## FOUR CASES:

Atrophy, autointoxication, chickenpox, chiggers, cramp, dandruff, exostosis, nevus, tumor, undescended testicle.

## THREE CASES:

Adhesions, amenorrhea, catarrh, chalazion, chapped lips, charley horse, color blindness, dry skin, malaria, nausea, nephritis, obesity, vomiting.

## TWO CASES:

Ankylosis, anorexia, carbuncle, glossitis, heat rash, heart trouble, hydrocele, ichthyosis, paralysis, poor posture, sciatica, seborrhea, soreness, muscle, stiffneck, synovitis, tinnitus aurium.

## ONE CASE:

Balanitis, dysuria, epilepsy, frost-bite, granulated eye, halitosis, heat stroke, hematuria, hemoptysis, hypertension, iritis, jaundice, miliaria, nasal obstruction, orchitis, psychosis, pyorrhea, scarlet fever, scoliosis.

TWENTY-FIFTH ANNUAL REPORT

## GENERAL SCIENCE

No. of teachers who taught General Science only .....	448
General Science, Accounting-Salesmanship .....	1
General Science, Agriculture .....	19
General Science, Agriculture, Chemistry .....	1
General Science, Agriculture, Physics, English .....	1
General Science, Art .....	2
General Science, Astronomy .....	1
General Science, Athletics .....	9
General Science, Auto-mechanics .....	1
General Science, Band .....	2
General Science, Biology .....	100
General Science, Biology, Agriculture .....	4
General Science, Biology, Agriculture, Mathematics .....	1
General Science, Biology, Agriculture, Physical Education .....	1
General Science, Biology, Art .....	1
General Science, Biology, Athletics .....	2
General Science, Biology, Band .....	2
General Science, Biology, Band, Physics, Mathematics .....	1
General Science, Biology, Botany .....	1
General Science, Biology, Chemistry .....	18
General Science, Biology, Chemistry, Home Economics .....	1
General Science, Biology, Chemistry, Physics .....	16
General Science, Biology, Chemistry, Physics, Band .....	1
General Science, Biology, Civics .....	1
General Science, Biology, History .....	6
General Science, Biology, History, Athletics .....	2
General Science, Biology, History, Civics .....	1
General Science, Biology, History, Civics, Industrial Geography .....	1
General Science, Biology, Hygiene .....	1
General Science, Biology, Hygiene, Mathematics .....	1
General Science, Biology, Hygiene, Physical Education .....	1
General Science, Biology, Mathematics, Athletics .....	1
General Science, Biology, Mathematics, Physics .....	2
General Science, Biology, Physical Education .....	6
General Science, Biology, Physics .....	19
General Science, Biology, Physics, Agriculture, Physiology .....	1
General Science, Biology, Physiography .....	1
General Science, Biology, Zoology .....	6
General Science, Botany .....	3
General Science, Botany, Agriculture, Zoology .....	1
General Science, Business .....	2
General Science, Business Training, Physical Education .....	1
General Science, Chemistry .....	59
General Science, Chemistry, Athletics .....	1
